
**"You work in data and AI all day —
how do you actually keep up
with what's happening?"**

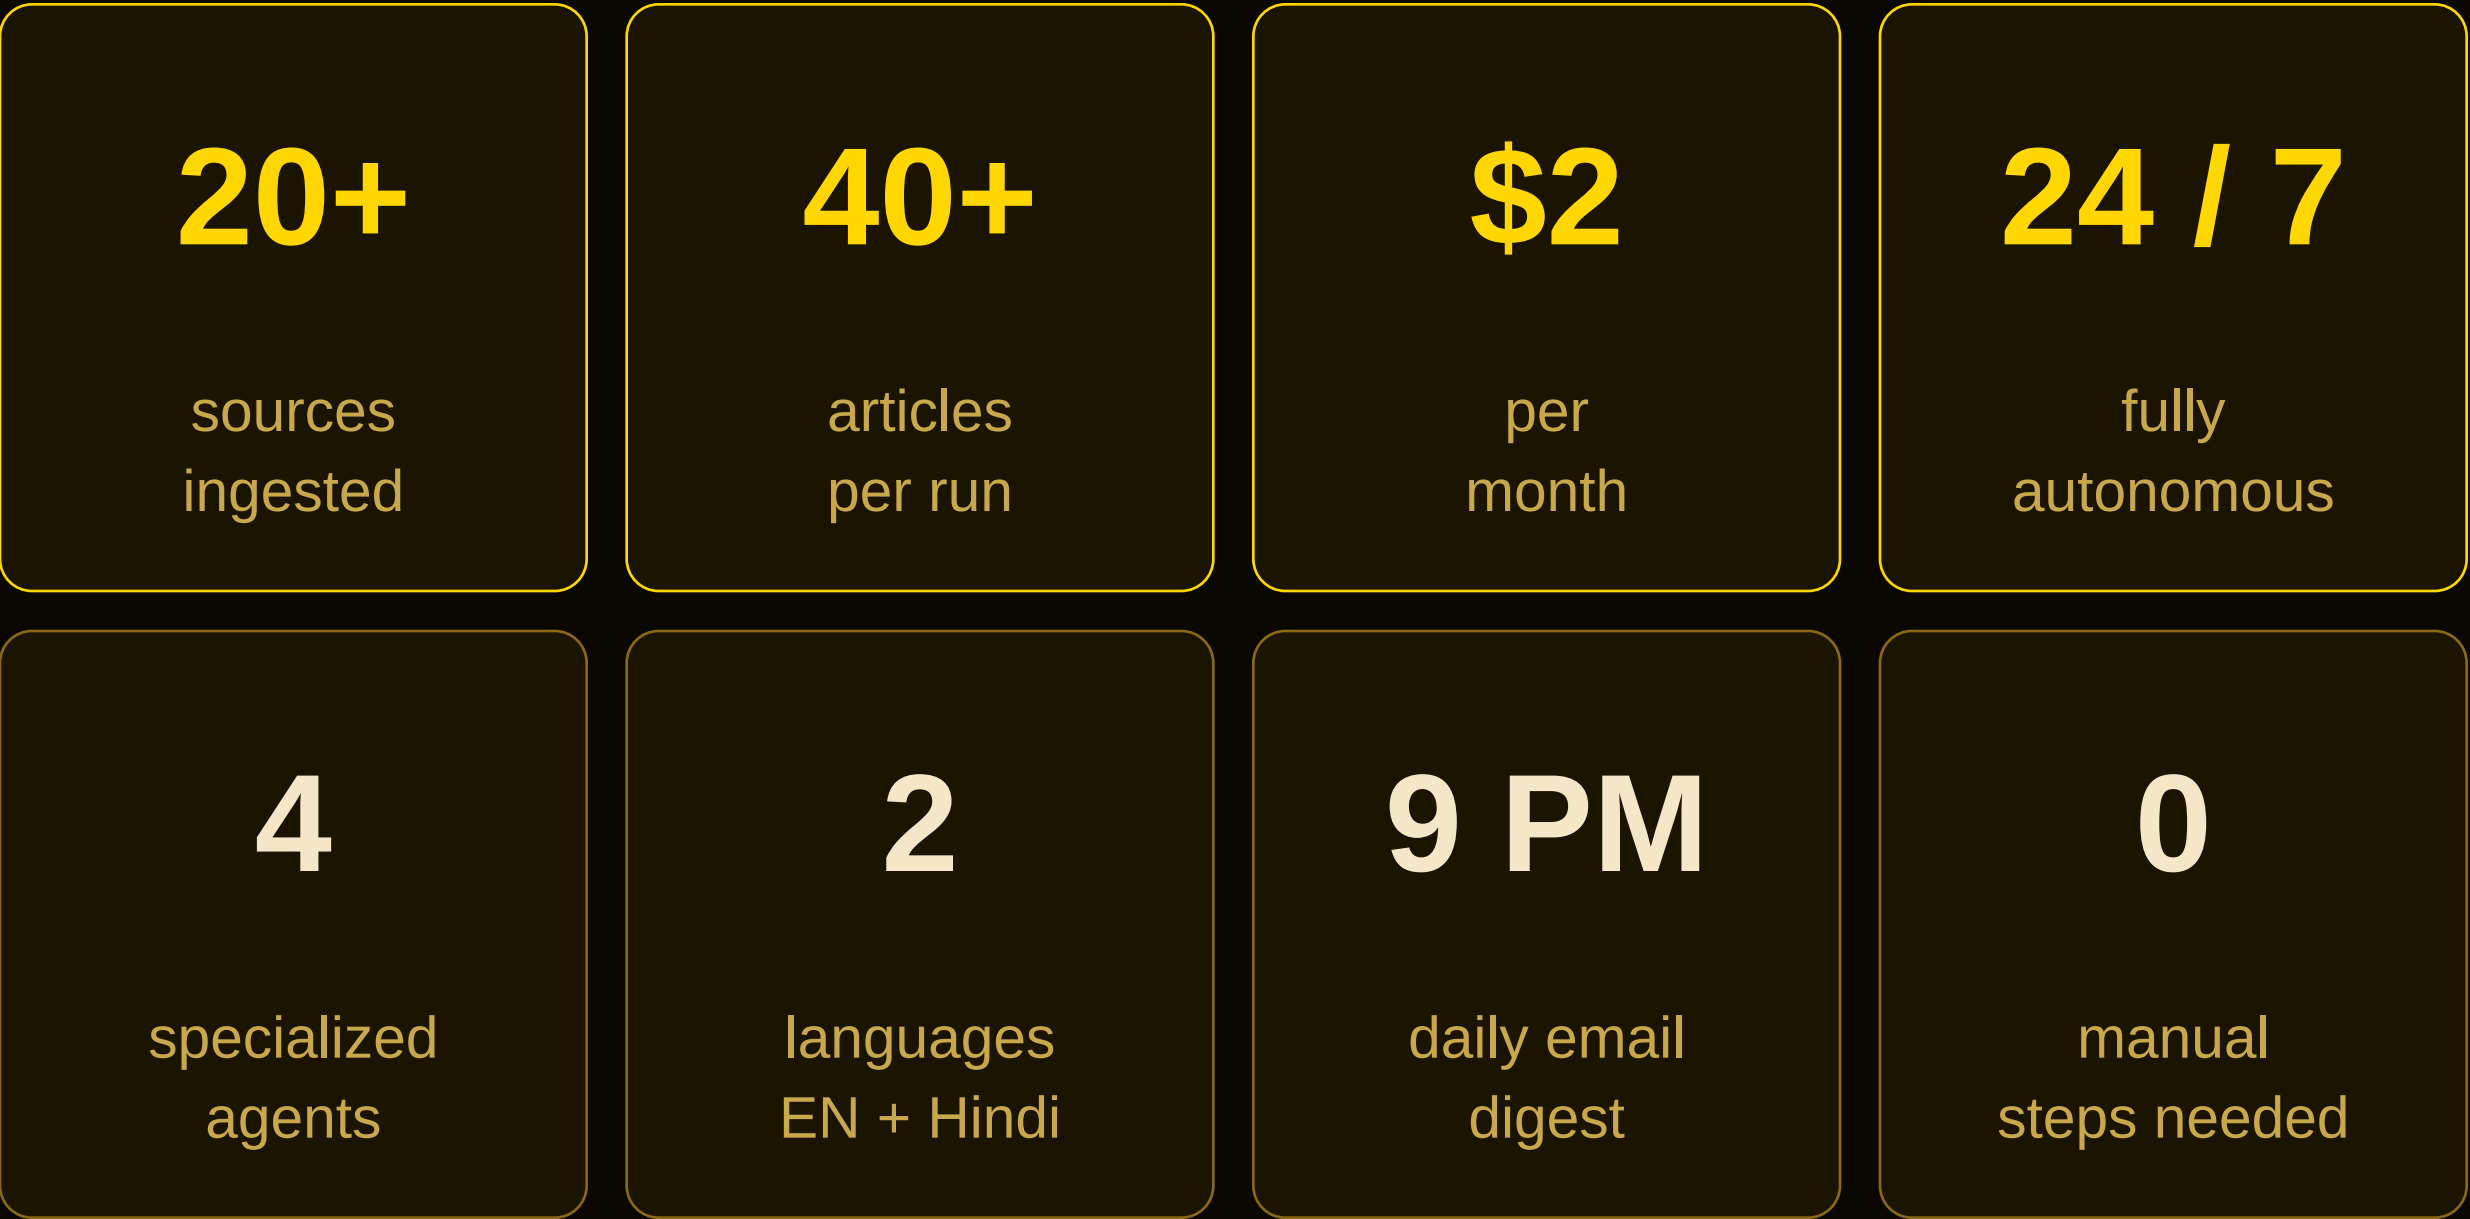

A friend asked me this.
I didn't have a good answer.

So I built one.

Abhi-Nexus — a fully autonomous multi-agent AI news system

Running 24/7 | \$2/month | Live now

By the numbers

Agent 01

Fetch

20+ RSS sources every 6 hours

Agent 02

Rank

GPT-4o-mini scores each article

Agent 03

Summarize

EN + Hindi TTS narration

Agent 04

Email

Digest delivered at 9 PM daily

Not all news is equal.

GPT-4o-mini reads every article and scores it 1–100 by real importance. Not keywords. Not recency.

Canvas breach — 275M students affected	90 / 100
Critical Windows zero-day patched	88 / 100
New AI model released by major lab	76 / 100
Interesting open-source tool launched	55 / 100
Minor AWS service configuration update	31 / 100

Batch size: 10 articles per API call | Cost: ~\$0.003 per full run

English + Hindi.

Click. Listen. Done.

English

Alloy voice

"A major data breach affecting Canvas has disrupted classes across the US."

Hindi

Shimmer voice

"Canvas platform mein ek bada breach hua hai. 275 million students ka data khatre mein hai."

OpenAI TTS-1 generates clean MP3 audio server-side.

No browser voice packs. No CORS issues. Just press and listen.

Anyone can listen — no login needed on the public page.

Engineering decisions

I am proud of.

Batching

10 articles per API call saves 75% cost. \$2/month not \$8/month.

Graceful degradation

One source fails? Pipeline continues. OpenAI down? Serve cached.

Dedup by content hash

MD5 on URL — same story from two sources appears once.

Settings from the UI

Scheduler interval, email time, recipients — no config files.

Live token tracker

Every API call logged. Know the exact cost in real time.

What I will not oversell.

Only ONE agent uses AI

The rank agent uses GPT-4o-mini to reason about importance. The fetch and email agents are smart Python automation. This is a hybrid system — and that was a deliberate choice.

Building > Reading

Knowing WHEN not to use AI is as important as knowing when to. Fetch and email need reliability, not intelligence. Adding AI where it adds no value increases cost and complexity.

Sophistication is knowing the difference.

It has been running for weeks
without me touching it.

That is the point.
